Topic 3.8 – Piecewise-Defined Functions – Algebra
Functions assign outputs to inputs. Some functions have simple rules, like "for every x, return x²." However, there can be other rules that are more elaborate. For example, "If x<0, return 2x, and if x ≥ 0, return 3x." These are called "piecewise functions", because their rules aren't uniform, but consist of multiple pieces.

Let's see, if you, yeah, that is negative 66 over 11, which is equal to negative six. So when x is equal to 10, our function is equal to negative six. And so this one actually doesn't have any jumps in it. It could've, but we see, so there we have it. We have graphed this function that has been defined in a piecewise way.
