

Research Paper On Hurricanes

Thank you utterly much for downloading research paper on hurricanes.Maybe you have knowledge that, people have see numerous period for their favorite books taking into consideration this research paper on hurricanes, but stop going on in harmful downloads.

Rather than enjoying a fine book once a mug of coffee in the afternoon, instead they juggled bearing in mind some harmful virus inside their computer. research paper on hurricanes is easy to use in our digital library an online entrance to it is set as public correspondingly you can download it instantly. Our digital library saves in combined countries, allowing you to get the most less latency epoch to download any of our books taking into account this one. Merely said, the research paper on hurricanes is universally compatible considering any devices to read.

Research Paper on Hurricanes - 1501 Words | Bartleby

A hurricane is a nautical storm originating from the west coast of Africa that can generate highly destructive winds. The more scientists understand hurricanes, the better we are able to predict what they will do and when they will make landfall.

Essays on Hurricane - Free Examples of Research Paper

Summary: This research will begin with the statement that the degree of preparation and response readiness that a community takes when a hurricane strikes can be the crucial factor in determining the lives and property that may be saved when this natural calamity strikes....

Preparation and Response to Hurricanes Research Paper

Sample Research Paper on Hurricane Katrina. Hurricane Katrina is one of the worst storms to have hit the Eastern coast of the United States leading to massive loss of life, destruction of property, and economic losses. There were numerous factors that contributed to the disaster being the worst in history including the physical and human geography as well as social factors such as poverty and gender marginalization.

Sample Research Paper on Hurricane Katrina - Essay Writing

Hurricanes are observed from the air by satellites and research and commercial planes. At sea they are watched by buoys and ships. Free essay samples and research paper examples available online are plagiarized. They cannot be used as your own paper, even a part of it. You can order a high-quality custom essay on your topic from expert writers:

Free Essay on Hurricanes | AnyFreePapers.com

600 Words | 3 Pages. Hurricanes get their start over the warm tropical waters of the North Atlantic Ocean near the equator. Most hurricanes appear in late summer or early fall, when sea temperatures are at their highest. The warm waters heats the air above it, and the updrafts of warm, moist air begin to rise.

Hurricanes Essay Examples | Kibin

Hurricanes are cyclones that develop over warm oceans and breed winds that blow yup to 74 miles per hour. In the hurricane the mixture of the water and winds can be extremely damaging. The winds are extremely dangerous and usually don't go faster than about 75 miles per hour but have been documented to go as fast as 85 miles per hour.

hurricanes - 558 Words | 123-Help.Me

One of the major social consequences of hurricanes is the loss of lives. It is almost inevitable and causes immense grief. During the passage of Hurricane Jeanne in Haiti in 2004, approximately 325 mm of rain fell which led to extensive flooding which drowned an estimated 3,000 people while Ivan in Grenada killed about 39 people in the same year.

Social and Economic Impacts of Hurricanes on the Caribbean

Hurricanes Introduction Hurricanes are one of the major disasters that can kill thousands of people in an instant. It is one of the most ferocious and devastating natural phenomena Hurricane is part of family of storms called tropical cyclone.Tropical disturbances such as clusters of thunderstorms accelerate the process by generating a column of rising air in the zone of low pressure...

A at an angle in terms of the components of a fluid, electric charge a premium meter in symbols, this is how it affects a managers challenge leading for innovation can be adjusted by turning spindles, called the force of ...

Losses to hurricanes in the 1990s total more than those incurred in the 1970s and 1980s combined, even after adjusting for inflation. This has led many to mistakenly conclude that severe hurricanes are becoming more frequent. In fact, according to recent research, the past few decades have seen a decrease in the frequency of severe storms and 1991 to 1994 was the quietest in at least 50 years. It does mean, however, that the world today is more vulnerable to hurricane impacts than it has ever been, which represents a serious policy problem. This book defines and assesses the hurricane problem, focusing primarily on the United States, in order to lay a foundation for action. The concept of vulnerability is used to integrate the societal and physical aspects of hurricane impacts. The book is unique in that it seeks to address both the scientific and societal aspects of hurricanes. While it focuses on the United States, it is intended to illustrate weather related impacts assessment that could be applied in other areas, and for phenomena other than hurricanes. More broadly, this book seeks to illustrate the beneficial uses (as well as limitations) of hurricane science to society. Explicit consideration of the relationship between science and society is much needed in an era when scientific research is under public and political pressure to demonstrate a better connection with societal needs.

There, undoubtedly, will be a flurry of research activity in the "Superstorm" Sandy impact area on a myriad of disaster-related topics, across academic disciplines. The purpose of this study was to review the disaster research related specifically to hurricanes in the educational and social sciences that would best serve as a compendium bibliography for researchers, academic faculty, and policymakers in the Hurricane Sandy impact area. To that end, this study, based on a content analysis procedure, identified key articles on hurricanes based on the extant literature indexed in the database PsycINFO. Of the 1,408 references identified, 1000 were scholarly qualitative and quantitative research articles. The author developed a bibliography of 100 key citations to articles, categorized across select topical areas, based on issues central to investigatory efforts following natural disasters. Future research should recommend research designs that address specific concerns of both researchers and policymakers in high-impact, heavily populated areas of the U.S. susceptible to major tropical storm or hurricane damage. (Contains 1 table.)

This book provides a wealth of new information, ideas and analysis on some of the key unknowns in hurricane research. Topics covered include the numerical prediction systems for tropical cyclone development, the use of remote sensing methods for tropical cyclone development, a parametric surface wind model for tropical cyclones, a micrometeorological analysis of the wind as a hurricane passes over Houston, USA, the meteorological passage of numerous tropical cyclones as they pass over the South China Sea, simulation modelling of evacuations by motorised vehicles in Alabama, the influence of high stream-flow events on nutrient flows in the post hurricane period, a reviews of the medical needs, both physical and psychological of children in a post hurricane scenario and finally the impact of two hurricanes on Ireland. Hurricanes discussed in the various chapters include Katrina, Ike, Isidore, Humberto, Debbie and Charley and many others in the North Atlantic as well as numerous tropical cyclones in the South China Sea.

This book provides research that shows tropical cyclones are more powerful than in the past with the most dramatic increases occurring over the North Atlantic and with the strongest hurricanes. Although such increases are correlated with warming oceans and are consistent with the thermodynamic theory of hurricane intensity, there remains doubt about the interpretation, integrity, and meaning of these results. Arising from the 5th International Summit on Hurricanes and Climate Change, this book contains new research on topics related to hurricanes and climate change. Bringing together international leading academics and researchers on various sides of the debate, the book discusses new research and expresses opinions about what is happening and what might happen in the future with regard to regional and global hurricane (tropical cyclone) activity.

Recent studies suggest that tropical cyclones are more powerful than in the past with the most dramatic increase in the North Atlantic. The increase is correlated with an increase in ocean temperature. A debate concerns the nature of these increases with some scientists attributing them to a natural climate fluctuation and others suggesting climate change related to anthropogenic increases in forcing from greenhouse gases. A Summit on Hurricanes and Climate Change was held during the spring of 2007 on the island of Crete that brought together leading academics and researchers on both sides of the scientific debate to discuss new research and express opinions about what will happen in the future with regard to hurricane activity. This proceedings volume highlights the state-of-the-science research into various aspects of the hurricane-climate connection. It is likely that the science presented here will lead to new research that will help answer crucial questions about our sustainable future.

A hurricane is a tropical storm with winds that have reached a constant speed of 74 miles per hour or more. Hurricane winds blow in a large spiral around a relative calm centre known as the "eye." The "eye" is generally 20 to 30 miles wide, and the storm may extend outward 400 miles. As a hurricane approaches, the skies will begin to darken and winds will grow in strength. As a hurricane nears land, it can bring torrential rains, high winds, and storm surges. A single hurricane can last for more than 2 weeks over open waters and can run a path across the entire length of the eastern seaboard. August and September are peak months during the hurricane season that lasts from 1 June to 30 November. This book presents the facts and history of hurricanes.

This book represents recent research on tropical cyclones and their impact, and a wide range of topics are covered. An updated global climatology is presented, including the global occurrence of tropical cyclones and the terrestrial factors that may contribute to the variability and long-term trends in their occurrence. Research also examines long term trends in tropical cyclone occurrences and intensity as related to solar activity, while other research discusses the impact climate change may have on these storms. The dynamics and structure of tropical cyclones are studied, with traditional diagnostics employed to examine these as well as more modern approaches in examining their thermodynamics. The book aptly demonstrates how new research into short-range forecasting of tropical cyclone tracks and intensities using satellite information has led to significant improvements. In looking at societal and ecological risks, and damage assessment, authors investigate the use of technology for anticipating, and later evaluating, the amount of damage that is done to human society, watersheds, and forests by land-falling storms. The economic and ecological vulnerability of coastal regions are also studied and are supported by case studies which examine the potential hazards related to the evacuation of populated areas, including medical facilities. These studies provide decision makers with a potential basis for developing improved evacuation techniques.

This book surveys the past, present, and potential future variability of hurricanes and typhoons on a variety of timescales using newly developed approaches based on geological and archival records, in addition to more traditional approaches based on the analysis of the historical record of tropical cyclone tracks. A unique aspect of the book is that it provides an overview of the developing field of paleotempestology, which uses geological, biological, and documentary evidence to reconstruct prehistoric changes in hurricane landfall. The book also presents a particularly wide sampling of ongoing efforts to extend the best track data sets using historical material from many sources, including Chinese archives, British naval logbooks, Spanish colonial records, and early diaries from South Carolina. The book will be of particular interest to tropical meteorologists, geologists, and climatologists as well as to the catastrophe reinsurance industry, graduate students in meteorology, and public employees active in planning and emergency management.
