Energy consumption is often also a determining factor in these devices. Today, some sensors have signal processing capabilities and are called intelligent sensors. On the other hand, the intelligence of these sensors (or of the systems in which they are integrated) can be improved with artificial intelligence techniques.

The front end of the data acquisition system amplifies and filters the signal of the sensor node. An amplifier and filter are crucial components in the initial signal processing. In data acquisition systems, the analog signal from the sensor has to be adjusted to suit the sampling frequency and the amplitude range needed by the analog-to-digital converter (ADC).
