In the past it was common practice to teach structural analysis and stress analysis, or theory of structures and strength of materials as they were frequently known, as two separate subjects where, generally, structural analysis was concerned with the calculation of internal force systems and stress analysis involved the determination of the corresponding internal stresses and associated strains.

Structural Analysis Equations
The structural stress or strain approach for assessing the fatigue strength and service life proceeds from the structural stress or strain amplitudes in the structural member and compares them with a structural stress or strain S-N curve. The structural (or 'geometric') stress or strain describes the macrostructural behaviour without consideration of local notch effects.

Structural Integrity Analysis 2. Fracture Mechanics stress cannot be larger than ultimate tensile strength, since this is a simplified correction for short cracks. Some plastic materials demonstrate slow crack extension before catastrophic failure. The safety margin in the presence of cracks is equal to the ratio of KIC to the maximum SIF.
